The invention has anti-HIV and virucide activities. Its mechanism of action is through inactivation of cellular ribosomes and enhancement of binding of the antiviral agent to galactose residues on cell surfaces, and its cellular internalisation. The invention is useful for treating human immunodeficiency virus infection and other viral infections, especially retroviral infections. The antiviral agent is activated in viral particles or early-stage infected cells, killing the cells upon infection and effectively preventing the integration of the viral genome into the host genome thereby preventing the latency/rebound problem. The agent enters all HIV susceptible cells, and not just cells known to act as host cells for the virus. The antiviral agent remains inert in a cell until degraded in it, unless the cell is infected with the virus, where the viral protease activates it.
                                                                                                                                                                                                                                                                                                                                                            Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cc given in AAI64139. The invention relates to a novel toxin (e.g., ricin) cc based antiviral agent which is toxic to virus-infected cells, but cc non-toxic to uninfected cells. The invention has anti-HIV and virucide activities. Its mechanism of action is through inactivation of cellular ribosomes and enhancement of binding of the antiviral agent to galactose residues on cell surfaces, and its cellular internalisation. The cc invention is useful for treating human immunodeficiency virus infection cand other viral infections, especially retroviral infections. The cc and other viral infections, especially retroviral infections. The cc antiviral agent is activated in viral particles or early-stage infected cc ells, killing the cells upon infection and effectively preventing the integration of the viral genome into the host genome thereby preventing the latency/rebound problem. The agent enters all HIV susceptible cells, cand not just cells known to act as host cells for the virus. The cc antiviral agent remains inert in a cell until degraded in it, unless the cc cell is infected with the virus, where the viral protease activates it.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAR06554
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The full-length sequences encoding ricin A (AAN70520), ricin D (AAN70525), putative ricin E (AAN70526) and RCA (AAN70524) in precursor form were obtd. using messenger RNA to obtain a cDNA library, and then probing the library to retrieve the desired cDNA inserts. The library was probed using the 35-mer given in AAN70514. Figure 4 (see AAN70520, AAN70521, AAN70522) shows the nucleotide sequences of three plasmids contg. cDNA inserts obtd. by probing a cDNA library for sequences encoding ricin B using the probe in AAN70517. The cDNA inserts can be placed into expression vectors. Site-directed mutagenesis may be used to place an AFG start codon and a Hindill site at the beginning of the mature protein (see AAN70518). The coding sequences of the inserts can be ligated into expression vectors contg. the PhoA promoter-operator and leader sequence (AAN7053) and suitable retroregulators.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pho A leader sequence can be used to manufacture genes encoding soluble, active, heterologous proteins for a bacterial expression system. Heterologous ricin A is soluble in the sonicate of cells and may be readily purified without detergent.

(Updated on 10-MAR-2003 to add missing OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              eukaryotic ribosomes and hence preventing protein production. Many conditions and the produced with an internal linker including different RIPs may be produced with an internal linker including maize RIP, Trichosanthin, Ricin A-chain, Abrin-A A-chain and Saporin. The RIPs can be used in the construction of therapeutic toxins targeted to specific cells such as tumour cells via the can be used in the construction of the rapeutic toxins targeted to specific cells such as tumour cells via the can be used in HIV therapy (see Us4869903). There is interest in expressing RIP recombinantly in host eukaryotic cells, because of the capacity to provide correct post-translational processing. However, RIPs effectively inhibit protein synthesis in eukaryotic cells resulting in cell death. Since the inactive RIP proteins are not cytotoxic to cells converted to active RIP proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

                                                                                                                                             밁
                                                                                                                                                                           Qy
                                                                                                                                                                                                                                                                                        The sequences given in AAW21698-710 represent Ribosome Inactivating CP Proteins (RIP's), which may be used in the construction of the protein of the invention. The proRIP has a selectively removable, internal peptide linker. The precursor sequence is incapable of inactivating eukaryotic ribosomes, but can be converted by removal of the linker into a protein having alpha and beta fragments and being capable of inactivating eukaryotic ribosomes. RIPs are potent inhibitors of eukaryotic protein synthesis. They possess a highly specific N-glycosidase activity which cleaves the glycosidic bond of adenine 4324 of rat liver ribosomal 28S RNA. RIP's selectively inhibit cellular proliferation of cells, e.g. cancer cells and HIV-infected T cellular proliferation of cells, e.g. cancer cells and HIV-infected T cells. The inactive proRIP proteins make it possible to provide protein consistive inhibitors with uses in practical and improved ways not before possible. The RIP can be used to make cytotoxic conjugates.
                                                                                                                                                                                                                                   Query Match

C;Comment: The functional molecule is a disulfide-linked dimer of A and B chains, which
C;Comment: The A chain inhibits protein synthesis; it inactivates the 60S ribosomal subunto the cell of the A chain; B chains are also responsible for cell agglutination (lectic) comment: This protein is cytotoxic and very poissonous to animals.
C;Comment: Trix ricin; rRNA relycosidase homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   C:Keywords: duplication; glycoprotein; glycosidase; hydrolase; lectin; RNA binding; seed F;1-35/Domain: signal sequence *stratus predicted <SIG>F;1-35/Domain: ricin D chain A *status experimental <ACH>F;36-302/Product: ricin D chain B *status experimental <ACH>F;46-293/Domain: rRNA N-glycosidase homology <RNG>F;315-576/Product: ricin D chain B *status experimental <BCH>F;313-373,374-414,417-455,462-497,501-540,543-576/Region: 40-residue repeats F;45,409,449/Binding site: carbohydrate (Asn) (covalent) *status experimental F;15,158,243,244/Binding site: substrate (Tyr, Tyr, Glu, Asn) *status predicted F;112/Active site: Glu *status experimental F;215/Active site: Arg *status experimental F;215/Active site: Arg *status experimental F;216-Active site: Arg *status experimental F;316-3649,360/Binding site: N-acetylgalactosamine (Asp, Glu, Asn) *status experimental F;316-3649,360/Binding site: N-

The toxin consists of an A chain, which in C; Comment: Abrin-a is more toxic than ricin. The A and B chains are linked by a single disulfit taining receptors on the cell surface. The A and B chains are linked by a single disulfit taining receptors.
